#### (54) PRINT SYSTEM

#### (57)Abstract:

PROBLEM TO BE SOLVED: To provide a print system capable of photographing by means of a digital camera corresponding to a key input from the operator panel of a printer and capable of printing, while selecting any one of a photographed image file, an image file photographed by the digital camera in the past and an image file stored in a mass storage.

SOLUTION: For this print system, the printer has the USB(universal serial bus) interface of mass storage class, so that the device of mass storage class can be connected and the image file can be directly printed out by the printer.

#### **CLAIMS**

#### [Claim(s)]

[Claim 1] The print system characterized by being able to perform connection of the device of a mass storage class and making an image file as for direct print-out to the aforementioned printer by giving the USB (Universal Serial Bus) interface of a mass storage class to a printer. [Claim 2] The print system according to claim 1 characterized by having the aforementioned printer characterized by providing the following. In order to connect the aforementioned printer and the aforementioned device of a mass storage class, the USB interface of the aforementioned printer and the USB interface of the aforementioned device are connected by the USB cable, and in the aforementioned USB interface of the aforementioned printer, it is a parallel interface connector. The USB series B plug connector which connects with a host computer and sends data to the aforementioned host computer to the BULK demand from the aforementioned host computer, and an Interrupt (interruption) demand. The operator panel which has the LCD panel which displays the key which is equipped with the USB series A plug connector which connects with the aforementioned device, carries out the same operation as the aforementioned host computer, and advances a demand to the aforementioned device using a BULK demand and an Interrupt demand, and outputs various directions, and the contents of directions.

[Claim 3] The print system according to claim 2 carry out having the aforementioned operator panel of the aforementioned printer which consists of the aforementioned device, the CAPTURE key which issue the directions to the aforementioned device at the time of connection, a LCD panel which display the state of the image file name memorized by the aforementioned device and the aforementioned device, the rise key which scrolls a LCD display upwards and the down key which scrolls a LCD display downward, and a SELECT key which use for selection and the mode selection of an image file as the feature.

[Claim 4] The print system according to claim 1 characterized by the aforementioned device being a digital camera.

[Claim 5] The print system according to claim 1 characterized by the aforementioned device being a removable desk.

[Claim 6] The print system according to claim 1 characterized by the aforementioned device being a hard disk.

[Translation done.]

Japan Patent Office is not responsible for any damages caused by the use of this translation. 1. This document has been translated by computer. So the translation may not reflect the original precisely.

2.\*\*\* shows the word which can not be translated.

3.In the drawings, any words are not translated.

# DETAILED DESCRIPTION

Detailed Description of the Invention

[The technical field to which invention belongs] It is related with the print system characterized key input from the operator panel of a printer, choosing the photoed image file or the image file photoed in the past with the digital camera, and the image file included in mass storage about a by for especially this invention being able to perform photography with a digital camera by the print system, and printing being able to do it.

directly and transmitting a picture It is not necessary to connect two AC adapters to an electric light line as electric supply to picture photography equipment being possible from a printer side. 252489.A, when linking picture photography equipments, such as a digital camera, with a printer cable, electric power is supplied by the digital camera through the feeder contained in this USB data is transmitted, the energization to the display means of picture photography equipment is When it becomes easy to manage the code of the circumference of a power supply and image [Description of the Prior Art] As this kind of print system is conventionally shown in JP,11-[0003] When a digital camera is connected to a printer through a USB (Universal Serial Bus) reduced, and a possibility that power supplies may run short is prevented.

[Problem(s) to be Solved by the Invention] The 1st trouble in this conventional print system is cable from the printer side to which the AC adapter was connected. [0004]

possible [print-out] for a printer only in operator operation from a camera in the print system of the conventional technology.

[0005] The 2nd trouble is that data are not direct made as for print-out to a printer with the conventional technology when a mass storage device is connected.

choosing the photoed image file or the image file photoed in the past with the digital camera, and [0006] The purpose of this invention is to offer the print system characterized by being able to perform photography with a digital camera in the key input from the operator panel of a printer, the image file included in mass storage, and printing being possible.

connected by the USB cable. to the aforementioned USB interface of the aforementioned printer It connects with a parallel interface connector and a host computer. The BULK demand from the out. A BULK demand, It has the aforementioned printer which is equipped with the USB series A interface of the aforementioned printer and the USB interface of the aforementioned device are aforementioned device and the same operation as the aforementioned host computer is carried printer, connection can do the device of a mass storage class and an image file is made as for [Means for Solving the Problem] By giving the USB interface of a mass storage class to a aforementioned host computer, The USB series B plug connector which sends data to the aforementioned host computer to an Interrupt (interruption) demand. It connects with the aforementioned printer and the aforementioned device of a mass storage class The USB direct print-out to the aforementioned printer by the print system of this invention. [0008] Moreover, in order that the print system of this invention may connect the

demand, and is equipped with the operator panel which has the LCD panel which displays the key olug connector which advances a demand to the aforementioned device using an Interrupt which outputs various directions, and the contents of directions.

0009] Furthermore, the print system of this invention has the aforementioned operator panel of which scrolls a LCD display downward, and a SELECT key which use for selection and the mode which issue the directions to the aforementioned device at the time of connection, a LCD panel which display the state of the image file name memorized by the aforementioned device and the the aforementioned printer which consists of the aforementioned device, the CAPTURE key aforementioned device, the rise key which scrolls a LCD display upwards and the down key selection of an image file.

[0010] Furthermore, the print system of this invention is characterized by the aforementioned device being a digital camera. 0011] Furthermore, the print system of this invention is characterized by the aforementioned device being a removable desk.

0012] Furthermore, the print system of this invention is characterized by the aforementioned device being a hard disk.

connection being able to do the device of a mass storage class and making an image file as for 0014] Next, the gestalt of operation of this invention is explained in detail with reference to a direct print-out to a printer by giving the USB interface of a mass storage class to a printer. [Embodiments of the Invention] The print system of this invention is characterized by for

operation gestalt, and drawing 3 are drawings showing an example of the operator panel of the invention, drawing in which drawing 2 shows an example of the interface of the printer of this [0015] The connection diagram in which drawing 1 shows the gestalt of 1 operation of this printer of the gestalt of this operation. The composition of the gestalt of this operation is explained with reference to drawing 1, drawing 2, and drawing 3.

[0016] Below, the case where a digital camera is used is described as a device of a mass storage

[0017] In order to connect a printer 10 and a digital camera 11, the USB interface 12 of a printer interface 12 of a printer from the former, It connects with the personal computer used as a host which sends data to a host computer to the BULK demand which is a demand of reception, and computer. The data transmission from a host computer, Or the USB series B plug connector 21 [0018] The parallel interface connector 20 of the printer interface currently used for the USB an Interrupt (interruption) demand, It has the USB series A plug connector 22 which connects computer, and advances a demand to a device using a BULK demand and an Interrupt demand. Furthermore, a printer 10 is equipped with the operator panel 15 which has the LCD (Liquid with the digital camera 11 equivalent to a device, carries out the same operation as a host Crystal Display) panel 34 which displays the keys 30, 31, 32, and 33 which output various 10 and the USB interface 13 of a digital camera 11 are connected by the USB cable 14. directions, and the content of directions.

upwards and the down key 32 which scrolls a LCD display downward, and a SELECT key 33 used for selection of an image file and mode selection are consisted of by the operator panel 15 of a may be turned off, the image file name which is contained in the digital camera 11 and the LCD [0019] The CAPTURE key 30 which issues directions so that the shutter of a digital camera 11 panel 34 which displays the state of a camera, the rise key 31 which scrolls a LCD display printer 10 at the time of a digital camera 11 and connection.

[0020] Drawing 4 is the flow chart of printer operation, and drawing 5 is drawing showing the flow drawing 3 , and operation of the form of this operation is explained with reference to <u>drawing 4</u> of the signal of a printer and a digital camera. It combines with drawing 1, drawing 2, and

0021] A printer 10 and a digital camera 11 are connected and it explains from the state of going 0022] A digital camera 11 is connected to the USB series A plug connector 22 by the USB into the mode in which a printer 10 carries out a direct access to a digital camera 11.

2003/09/19

[0023] Next, when it keys by the CAPTURE key 30 which issues directions so that the shutter of the digital camera 11 of the operator panel 15 may be turned off, in a digital camera 11, it is Capture. Command50 is sent. A digital camera 11 performs photography processing 59 (S41). A printer 10 is Status every fixed interval of a certain. Command51 is sent.

[0024] When a digital camera 11 is 60 in an image processing, the status 52 in an image processing is returned to a printer. At the time under image processing, "Processing" is displayed on the LCD panel 34 (S42).

[0025] Status By Command53, when a camera is not 60 in an image processing, the Idle state status 54 is returned to a printer 10. It is recognized as the printer 10 having carried out the image processing to receiving the Idle state status 54, and changes to the LCD panel 34 like drawing 3 at the file name display in a digital camera 11 (S43).

sector of No. 4, and the read-out size from there is set to a number of cylinders, and decided). A the selected file is completed. It returns to Command55 and reception of image data is repeated. constitutionally, a thing of a mass storage device called a cylinder, a header, and a sector exists, drawing 3 at the file name display in a digital camera 11 (S43). [0026] Next, the operator of a printer chooses an image file by the rise key 31 of a scrolling key and the down key 32 of LCD panel 34 display, pushes the SELECT key, and is Read to a digital USB) to Bulk of USB as an image data demand. Request57 is taken out. A digital camera 11 will When the received data are an image file, a printer 10 prints out by changing an image file into processing. Next, a printer 10 is Data (as opposed to the port which performs data transfer of the operator panel 15 or the format chosen by default setup from the start at print data (S45). digital camera 11 is ReadCommand to a printer 10, after the image data selection 62 finishes. be in image data transfer 63 state, and will send image data 58 to a printer 10. It is Read until Then, return processing can be continued to \$41 and \$44. It explains from the state of going into the mode which combines explanation of the form of other operations of operation with it sets to deciding a read-out position with No. 3 of a cylinder, the header of No. 1, and the drawing 5 about connection between a printer 10 and the device (it replaces with the digital camera 11. Command55 is sent. Read Command55 chooses the number of cylinder header  $\frac{drawing\ 1}{drawing\ 2}$  , and  $\frac{drawing\ 3}{drawing\ 3}$  , and carries out a direct access using  $\frac{drawing\ 4}{drawing\ 4}$  and ACK (Acknowledge)56 is returned (S44). Image data selection processing is automatically performed at the time of the mode which prints immediately the data which photoed this selector sector sectors of image data (in order to choose the memory area of a device, camera 11 of drawing 1) of the mass storage class of a USB interface. A device puts a removable desk, a hard disk, etc.

[0027] The device of a mass storage class is connected to the USB series A plug connector 22 by the USB cable 14, and a file name is displayed on the LCD panel 34 like <u>drawing 3</u>. Then, operation of S44 to use is attained. Next, it explains from S44.

[0028] When an image file is chosen and it pushes SELECT key 33 by the rise key 31 of the scrolling key on the operator panel 15 of a printer 10, and the down key 32, it is Read to a mass storage device. Command55 is sent. Read Command55 chooses the number of cylinder header selector sector sectors of data. A mass storage device is Read to a printer 10, after the selection 62 of image data finishes. Command ACK (Acknowledge)56 is returned (S44). [0029] Next, a printer 10 is Data to the port which performs data transfer of USB as an image data demand. Request57 is taken out. A mass storage device will be in image data transfer 63 state, and will send image data 58 to a printer 10. It is Read until the selected file is completed. It returns to Command55 and reception is repeated. When the received data are an image file, a printer 10 prints out by changing an image file into the operator panel 15 or the format chosen by default setup from the start at print data (S45). Then, return processing can be continued to S44.

[0030]

[Effect of the Invention] as explained above, the effect of this invention is that a print system is realizable easily, when connection can do a printer and a digital camera direct and remote operation of a digital camera can perform from a printer the thing which turn off the shutter of a

digital camera and for which photography directions can be issued like, that picture selection in a digital camera can be performed from a printer, and printing out an image file by the bird clapper possible

[0031] Moreover, it is direct connection between a printer and the mass storage device of a USB interface being performed, and file selection being performed from a printer, and enabling possible print-out of printing out the image file of a mass storage device without a personal computer to a printer by the bird clapper of an image file.
